Fluid Sealing Association

STANDARD

FSA-DSJ-401-07
SPECIFICATION FOR
HIGH TEMPERATURE AND ACID RESISTANT
TERPOLYMER FLUOROELASTOMER

REVISED JULY, 2007

This is an editorial revision only.
The standard currently is under technical review and a revision is forthcoming.

1. SCOPE

1.1 This specification provides requirements for the terpolymer fluorocarbon elastomer used in the manufacture of expansion joints for application in coal fired utility and other high temperature industrial applications where corrosive flue gases are present.

1.2 While the materials, methods, applications and processes described or referenced in this standard may involve the use of hazardous materials, this standard does not address the hazards which may be involved in such use. It is the sole responsibility of the user/tester to ensure familiarity with the safe and proper use of any hazardous materials and testing and to take the necessary precautionary measures to ensure the health and safety of all personnel involved.

2. REFERENCED DOCUMENTS:

2.1 ASTM International Standards:

   ASTM D-412 Rubber Properties in Tension
   ASTM D-471 Rubber Property - Effect of Liquids
   ASTM D-573 Rubber - Deterioration in an Air Oven
   ASTM D-2240 Rubber Property - Durometer Hardness
   ASTM D-297 Rubber Products - Chemical Analysis

2.2 Fluid Sealing Association

   FSA DJS-402-06 Fluoroelastomer Belt Recommendation

3. SIGNIFICANCE AND USE

This specification is intended as a reference procedure for evaluating the performance of vulcanizates based on terpolymer fluorocarbon elastomers used in expansion joints. It can be used for quality assurance testing prior to release of a lot based on agreement between supplier and purchaser.

4. MATERIAL REQUIREMENTS

4.1 Material shall be based on 100% virgin fluoroelastomer terpolymer of at least 68% by weight of fluorine content. The compound shall contain no less than 70% by weight of fluoroelastomer. The remaining 30% by weight shall be comprised of thermal carbon black as reinforcing filler with calcium hydroxide, magnesium
oxide and minimal process aids (<5% by weight). The fluoroelastomer curative shall be of the dihydroxy, bisphenol type. No amount of reprocessed fluoroelastomer scrap or non-fluoroelastomer polymer is acceptable.

4.1.1 Four products known to meet 4.1 are Dai-el™ brand terpolymer fluoroelastomer bisphenol-cured, Dyneon™ terpolymer fluoroelastomer incorporated cure products, Tecnoflon™ brand terpolymer fluoroelastomer incorporated cure products and Viton™ brand fluoroelastomer (B type) products bisphenol-cured. Other equivalent fluoroelastomer terpolymers of at least 68% by weight fluorine content with equivalent curatives are acceptable.

4.2 As received virgin fluoroelastomer sampled in accordance with Section 5.5 typically shall be fully pressure cured for 20 minutes at 150°C (302°F) but not post cured. Other time/temperature conditions may be acceptable providing they produce vulcanizates that meet the property requirements. The sample must meet the physical property requirements shown in Table 1.

5. QUALITY ASSURANCE PROVISIONS

5.1 Quality

The product, as received, shall be uniform in quality and condition, smooth, as
free from foreign materials as commercially practical, and free from
imperfections detrimental to use as intended.

5.1.1 Responsibility for Inspection

The seller of the expansion joint shall be responsible for having all the
required specification tests performed. The buyer reserves the right to
obtain additional batch samples and perform all confirmatory testing
he/she deems necessary to ensure the product conforms to the full
requirements of this specification.

5.2 Classification of Tests

5.2.1 Acceptance Tests

The seller of the expansion joint shall be responsible for checking the
batch sample test results, confirming that the results are in accordance
with this specification and preparation of the "Batch Test Certification"
report. The buyer reserves the right to perform confirmatory tests as
deemed necessary to ensure that the product conforms to the "Batch Test
Certification" and the full requirements of this specification.

5.2.2 Traceability

Shipments and certification with test values from test in Table II shall include traceability back to polymers, grade, and lot number.

5.3 Periodic Tests

Test for requirements shown in Table III are periodic tests and may be performed at purchaser's discretion unless the purchaser specifies frequency of testing.

5.4 Preproduction Tests

Tests for all technical requirements are preproduction tests and shall be performed prior to or on the initial shipment of the expansion joints to the buyer or when a change of ingredients and/or processing requires re-approval or when buyer deems confirmatory testing is required.

5.5 Sampling and Testing Shall Be As Follows:

5.5.1 For acceptance tests, sufficient product shall be taken at random from each lot to perform all required tests. The number of samples tested per lot shall be no less than 3.

5.5.2 ASTM test specimens shall be prepared from the same batch of polymer/compound as the material being supplied and shall be fully press cured as specified in 4.2.

5.5.3 A lot is the entire product from the same batch of compound processed in one continuous run and presented to the purchaser at one time.

5.5.4 A batch is the quantity of compound run through a mill or mixer at one time.
5.5.5 Ingredients and manufacturing processes used on specification test samples shall be the same as those on the approved product.

5.6 Reports

Report shall be furnished showing the test results on each lot to determine conformance with acceptance requirements. Documentation must include traceability back to polymer type, supplier, and supplier's lot number.
