

ITT Sells Pumps for Indian Irrigation Project

ITT Corporation, a world leader in water transportation and treatment, is heading a consortium that has been awarded a contract to provide two water pumping stations for Sardar Sarovar Narmada Nigam Limited's (SSNNL) Kutch Branch Canal (KBC) Lift Irrigation Project. Combined, these two pumping stations will have the capacity to pump 196 million liters daily. The order is valued at \$74 million and is slated to be completed by end of 2012. The KBC project, on completion, will bring water to 279,000 acres of land within 182 villages in the Kutch District.

ITT will execute this project in a consortium with Megha Engineering & Infrastructures Limited (MEIL). ITT's Flygt® vertical column discharge pump sets are at the heart of the system, and will be the largest pumps of their kind to be built and/or operated in India. The contract also calls for complete pump house equipment including electrical, mechanical and instrumentation.
