

Modifying Ash Resistivity and Improving ACI Performance for Mercury Control with Liquid Flue Gas Conditioning

McIlvaine Hot Topic
January 20, 2011

ADA Environmental Solutions creates and delivers cutting edge technical and chemical solutions to reduce emissions from coal-fired power plants, Portland cement kilns and industrial boilers, helping customers meet environmental goals while balancing their business needs.

ADA Experience with FGC and ESPs

- Have been providing flue gas conditioning systems for ESPs since 1997
- Recognized experts in ESP troubleshooting and performance evaluations
 - In house tools for resistivity measurement and ESP modeling
 - Provide support with specification, selection and start-up of ESPs and baghouses on utility boilers

Typical Temperature Resistivity Relationship

FGC: How It Works

- Resistivity modification of particulate layer
 - Resistivity mid- 10^9 to $<10^{11}$ ohm-cm is optimal
 - Too high ($>10^{11}$ ohm-cm yields poor charging and/or back corona
 - Below 10^9 yields maximum ESP power but can increase reentrainment
- Provides ability to vary injection rate with varying ash characteristics and operating conditions
- Liquid spray injection of chemical additives
 - Flash evaporation of additive spray droplets
 - Co-deposition onto ESP collection plates
 - Electrical conductivity through surface moisture on particles improved via chemical alteration

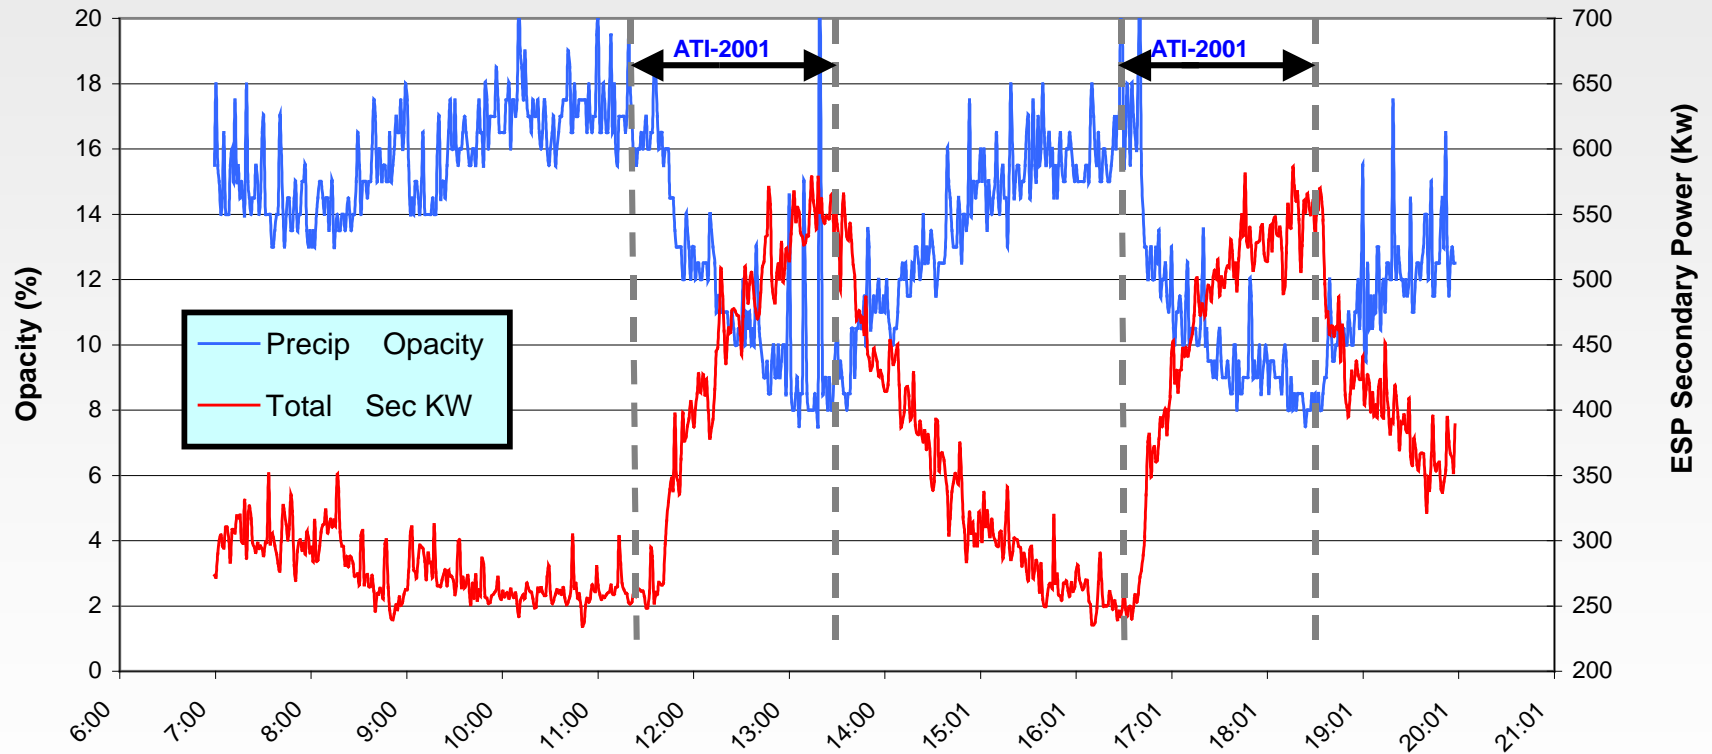

Liquid FGC Chemical (ATI-2001™)

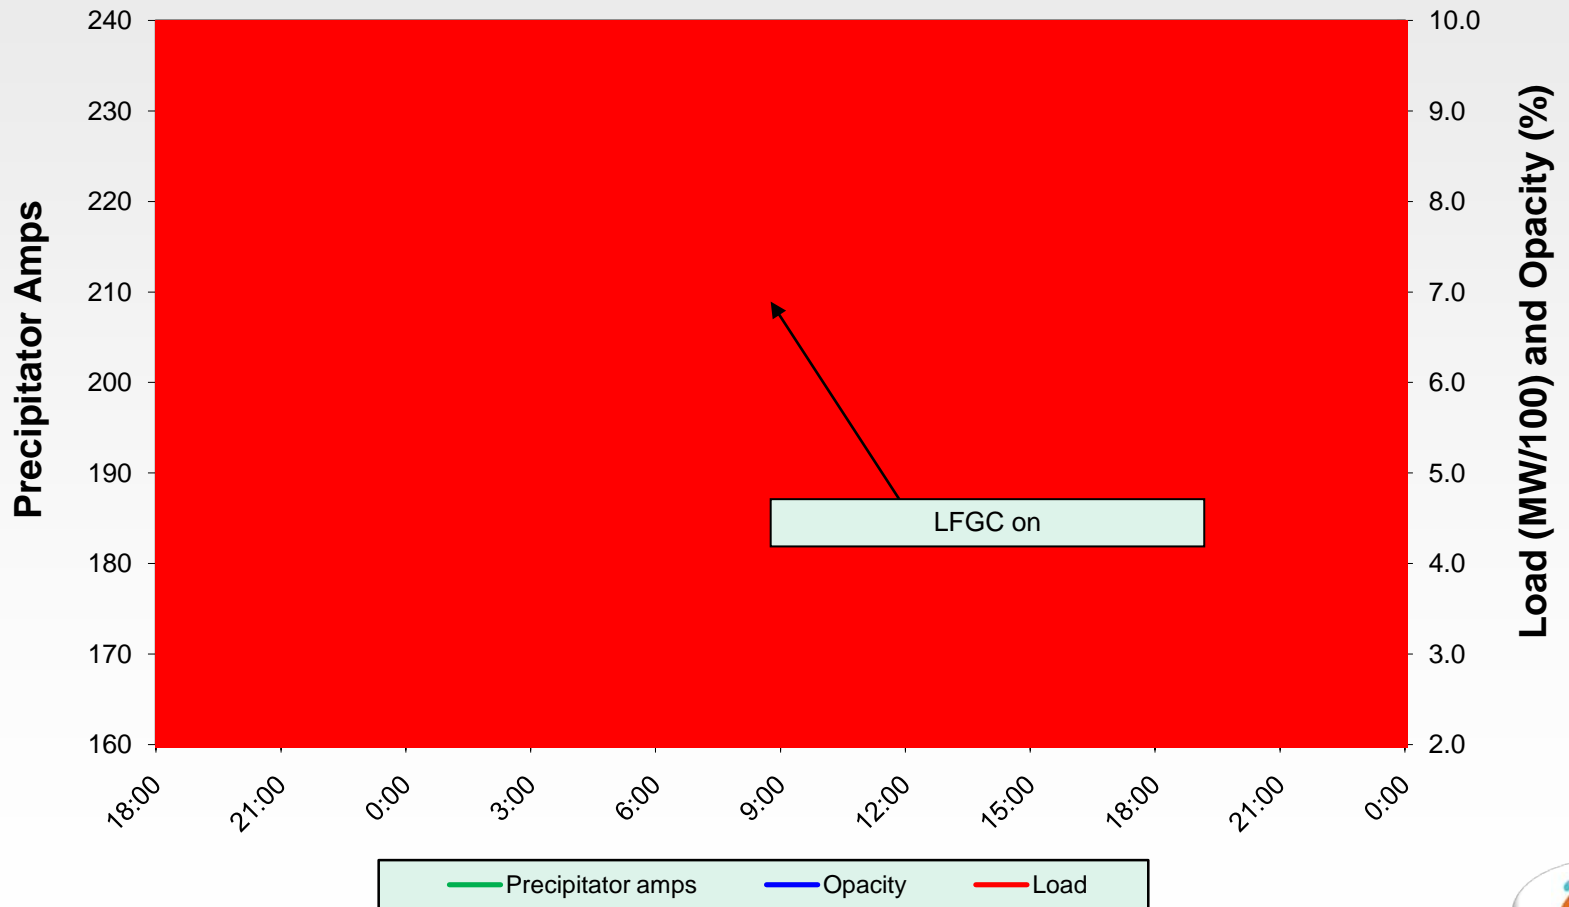

- Effective resistivity modifier w/PRB or bituminous fly ash
- As-needed injection for problem coals
- Long-term conditioning as SO₃ replacement
- Effective temperature range 250 to 500°F
- Does not interfere with activated carbon for Hg control
- Does not affect the ability to sell the fly ash

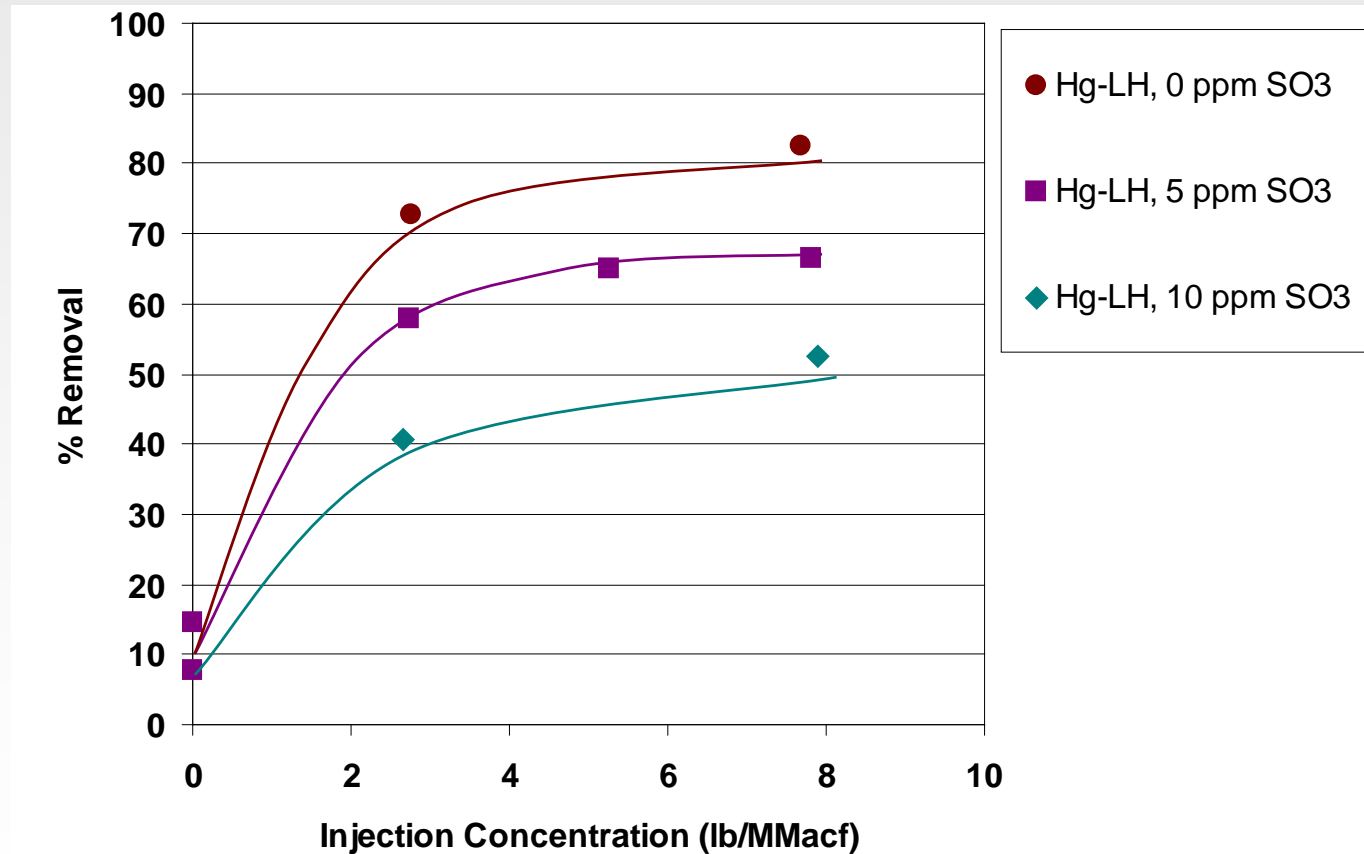

ESP Response with LFGC

ESP Response with LFGC

Impact of SO₃ on PAC Performance

Chemical Injection Skid

Liquid Distribution Manifold

Injection Lance Grid

LFGC as Replacement for SO₃

- ATI-2001 designed for utility ESPs and has been in commercial use for over 10 years
- Recently completed several successful demos with ATI-2001 LFGC as an SO₃ replacement
- Low cost, small foot print injection equipment
- One customer using ATI-2001 with activated carbon and achieving > 90% Hg control
 - Opacity levels maintained
 - Activated carbon usage reduced for mercury control

Summary

- SO_3 impacts the performance of PAC for Hg control
- ADA offers an alternative resistivity modifying chemical and injection system
 - Demonstration equipment available for short-term tests
 - Equipment lease w/purchase option
 - Permanent injection system

Creating a Future with Cleaner Coal

COO

ADA Environmental Solutions

(303) 734-1727

Equipment

- Low cost, small footprint
- Low utility power requirements
- Injection equipment connected to plant controls
- Includes: chemical storage tank, injection skid, transport piping, chemical and compressed air distribution manifold, injection lances, shield air blower
