## Sorbacal® Dry Sorbent Injection - a low capital solutions for HCl control

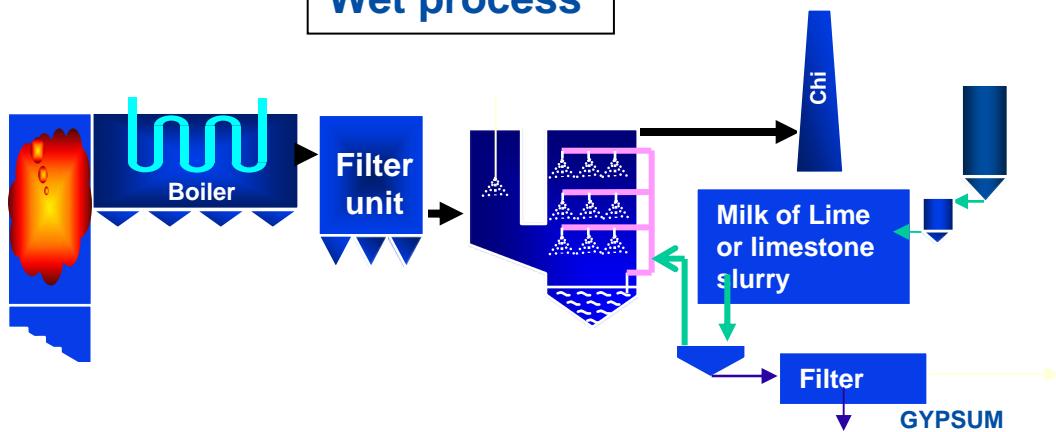

- LNA experience with Dry Sorbent Injection
- What are the factors that impact DSI effectiveness?
- Review of proven DSI experience

# Wide range of Flue gas Treatments processes

**Wet process**

# DSI - Dosing unit & blower

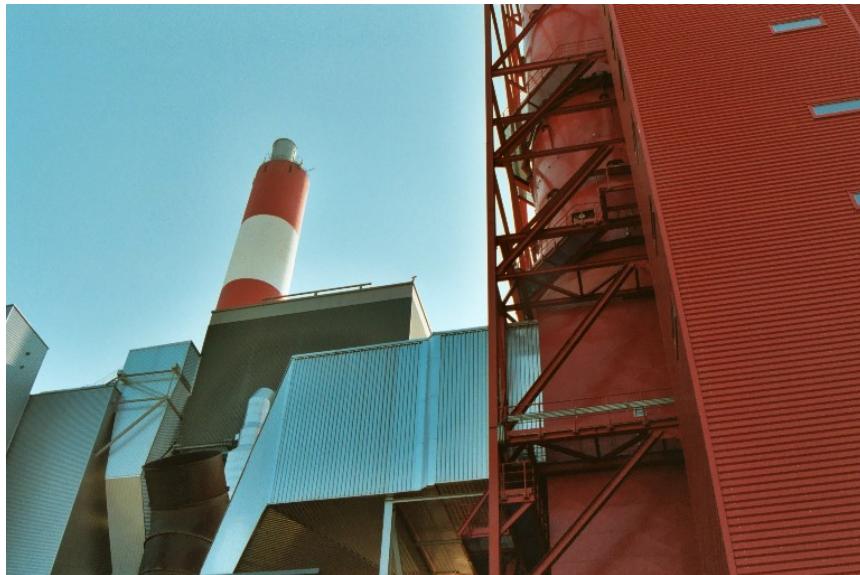

# DSI - Injection points

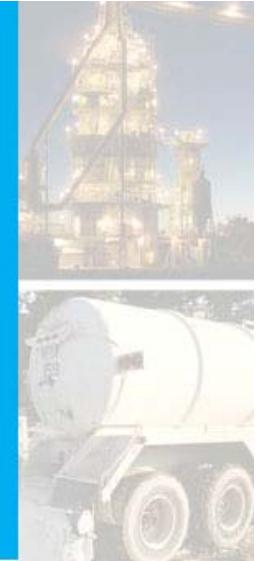

# Sorbacal® DSi – Factors that impact effectiveness

- Flue gas properties
  - ✓ Temperature
  - ✓ Moisture
  - ✓ Competing acid gases
  - ✓ CO<sub>2</sub> concentration
- Reagent properties
  - ✓ Particle surface area
  - ✓ Pore shape, size and volume
  - ✓ Particle size distribution
- System properties
  - ✓ Distribution of reagent injection
  - ✓ In-flight residence time
  - ✓ Particulate control device

# Flue Gas Properties – Impact of Moisture and temperature

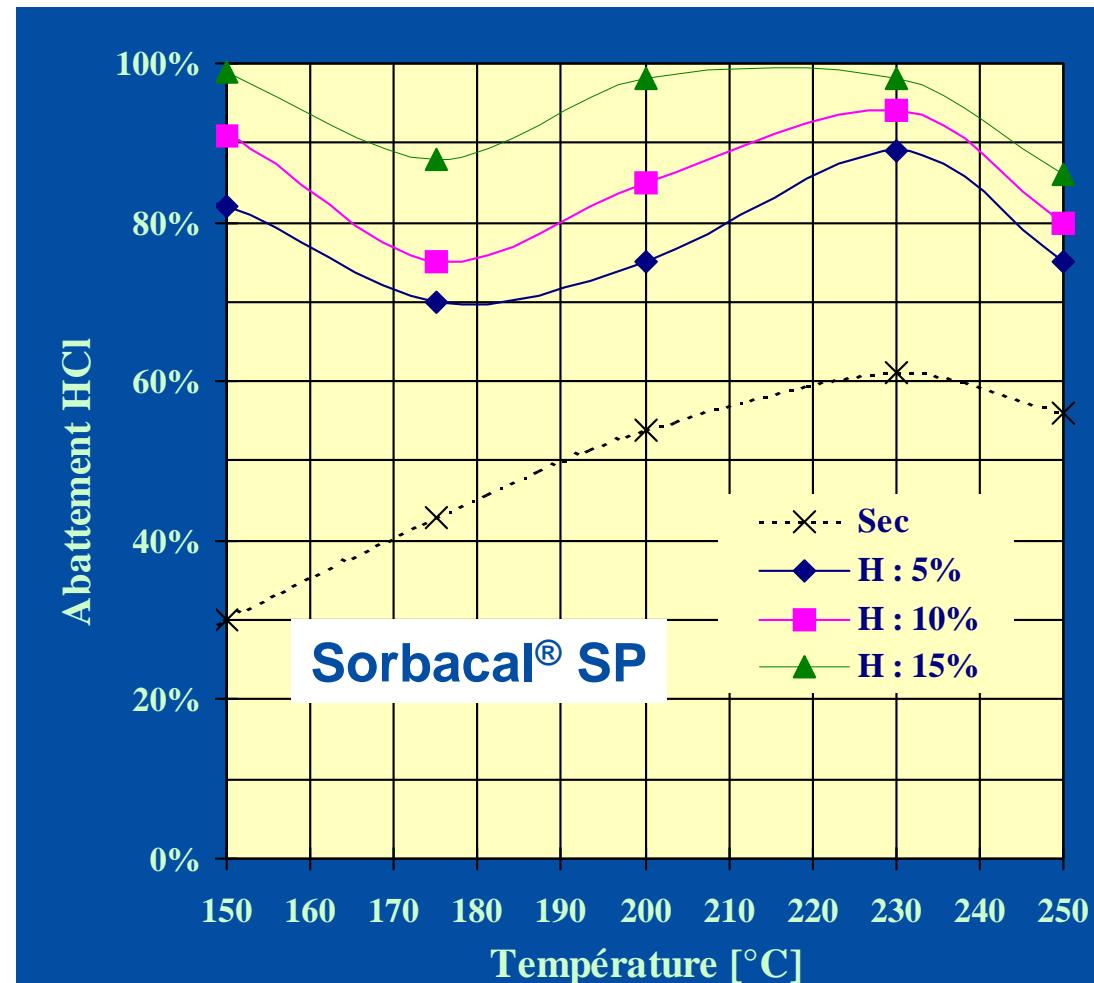

## Acid Gas Hierarchy

$\text{SO}_3$

HF

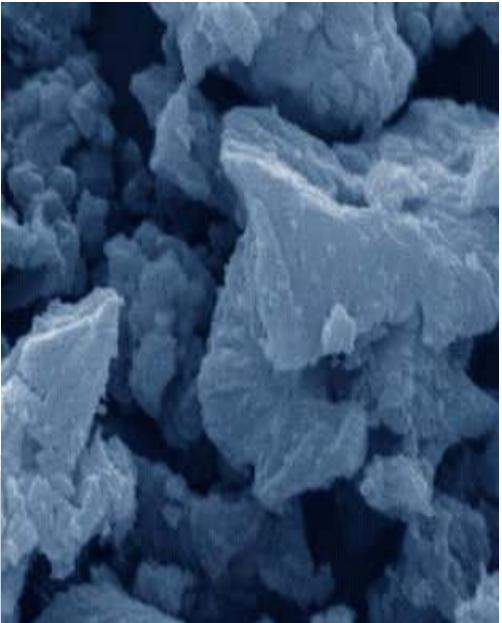

HCl

$\text{SO}_2$

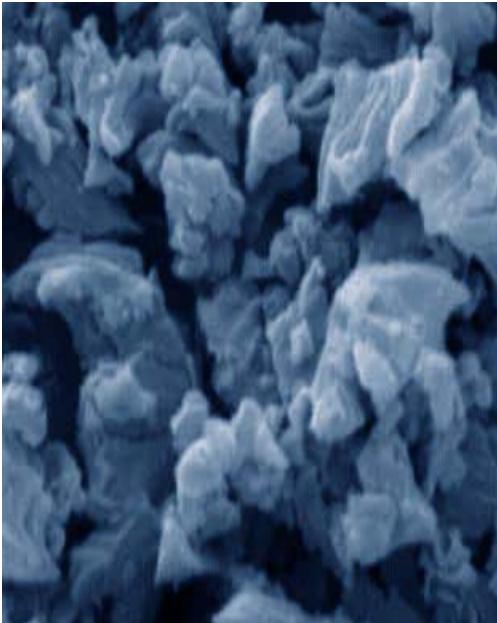

HCl : 1200 mg/Nm<sup>3</sup> - CO<sub>2</sub> : 9 % - RS : 1,7

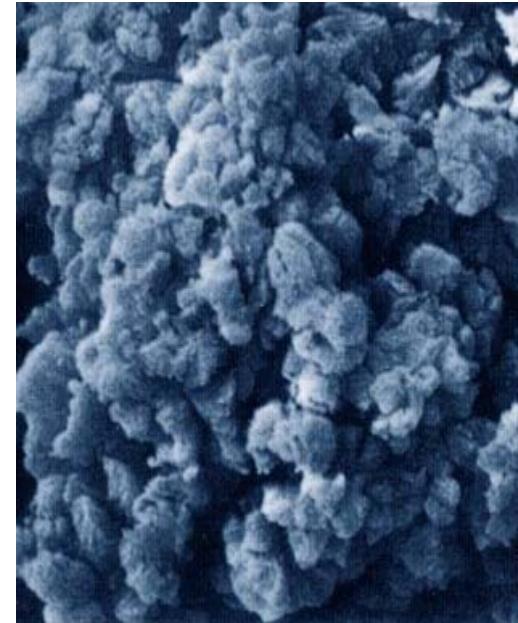

# Reagent Properties – Impact of surface area & pore characteristics

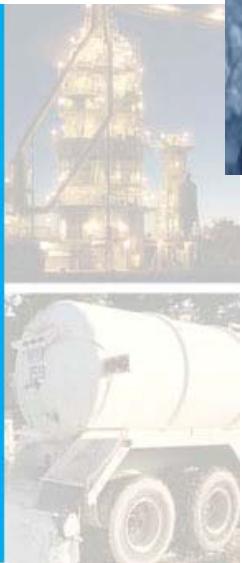

Sorbacal® H  
Standard  
Hydrated lime

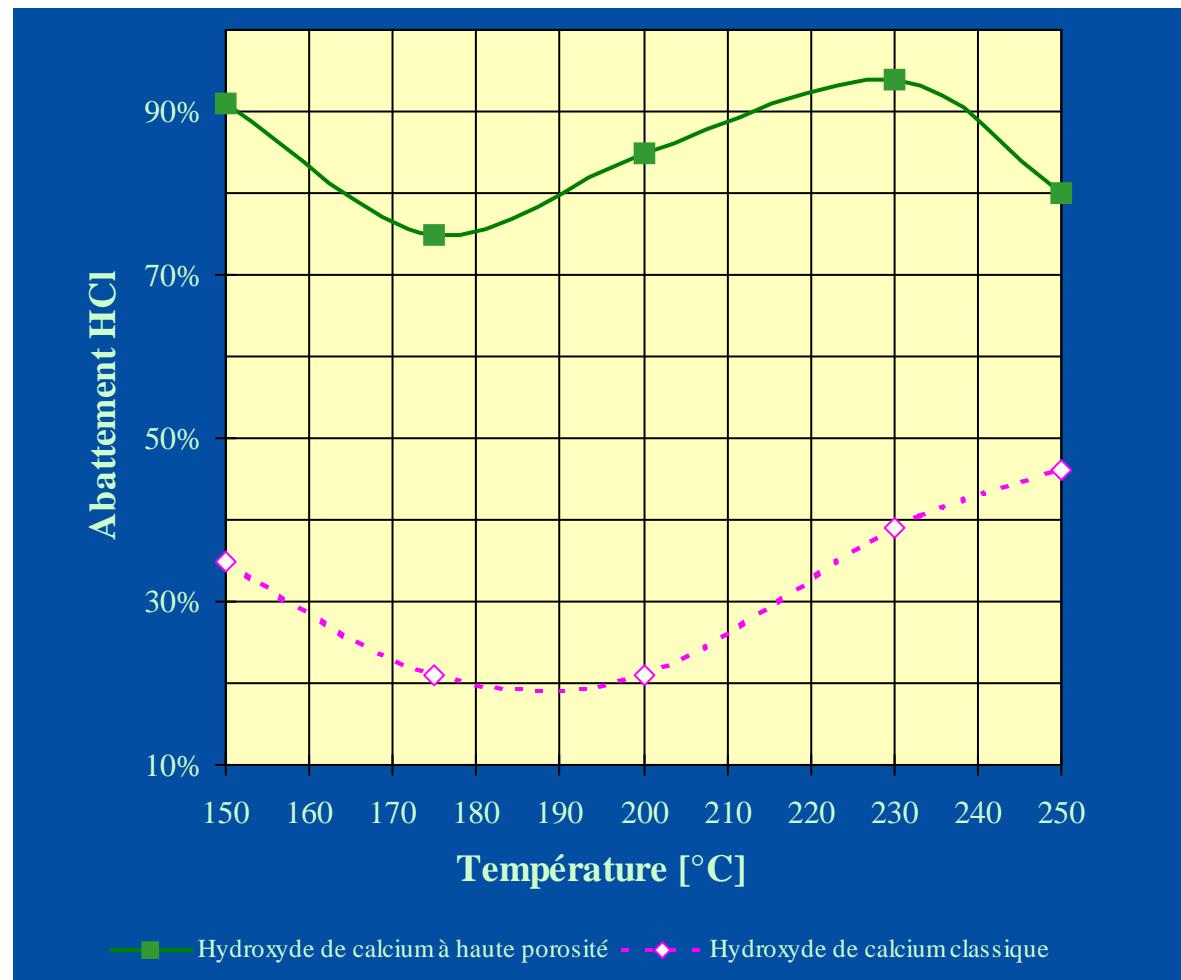

Sorbacal® A

Sorbacal® SP

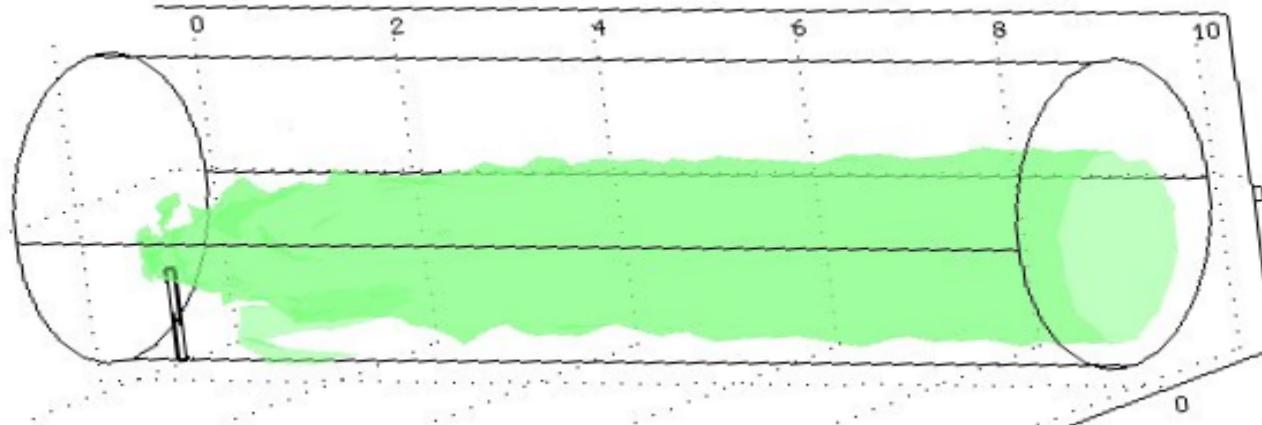

# Dechlorination performance Sorbacal® SP vs. standard hydrated lime

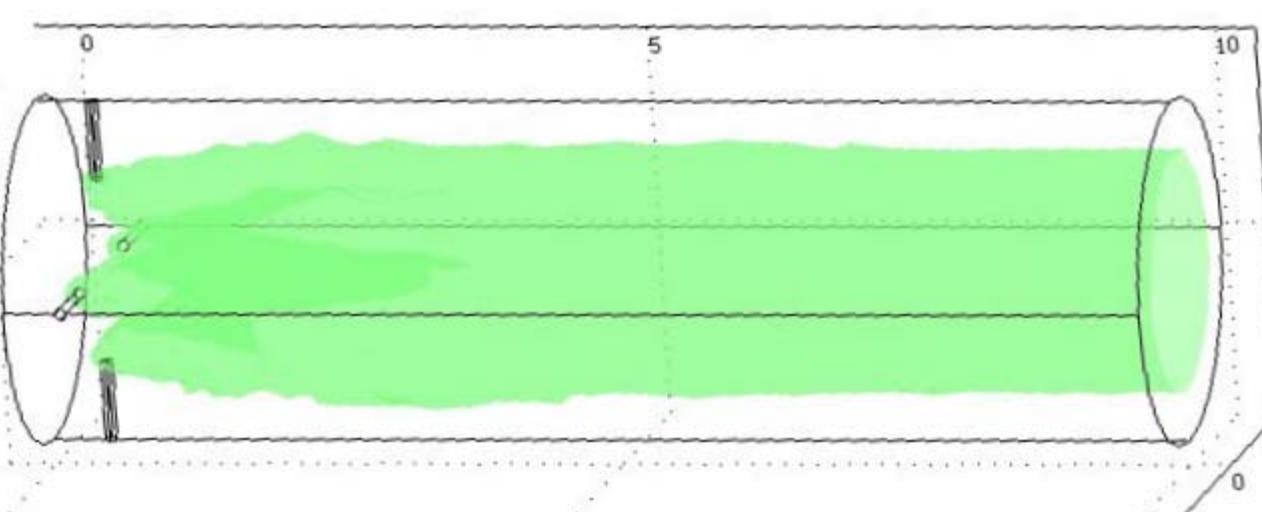

**HCl : 1200 mg/Nm<sup>3</sup> - H : 10 % - SR : 1,7 - CO<sub>2</sub> : 9 %**

# System Properties – Sorbent Dispersion

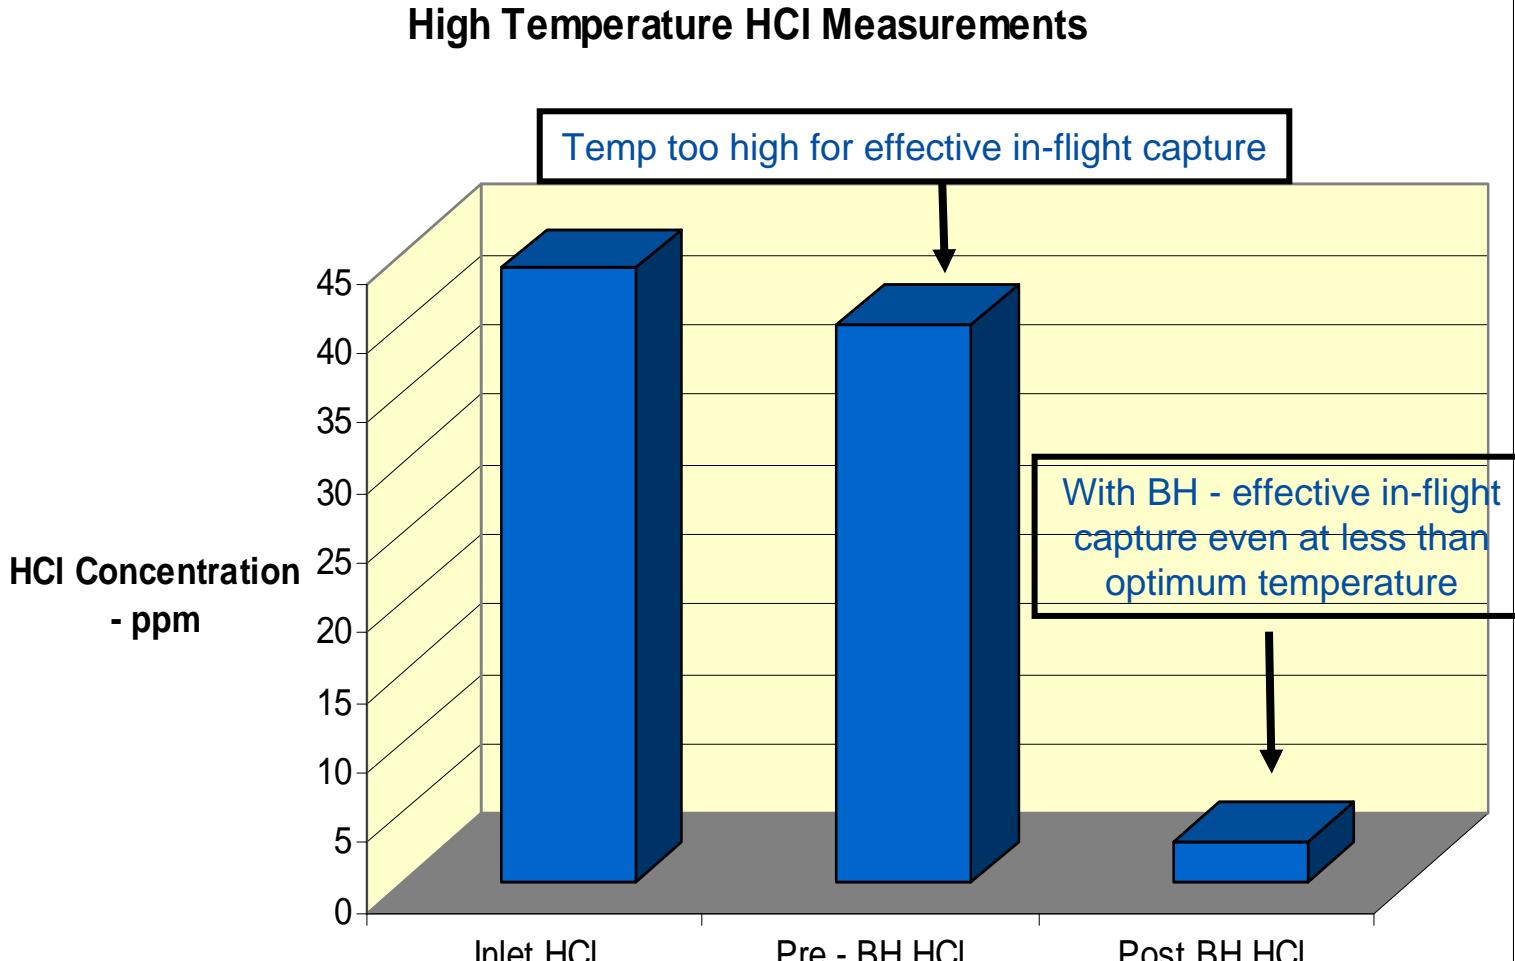

**1 Injection Point:**  
**Penetration: 1m**  
 **$V_{Inject}$ : 20 m/sec.**  
**Length: 10 m**

**4 Injection points, 90°:**  
**Penetration: 0,75m**  
 **$V_{Inject}$ : 20 m/sec.**  
**Length: 10 m**

# Recent pilot combustor results - High Injection Temp results

- HCl can be effectively controlled by the injection of calcium hydroxide reagents
- Effectiveness a function of;
  - ✓ Flue gas properties
  - ✓ Reagent properties
  - ✓ System properties
- Field Trials can be typically be performed
- Further R&D to improve efficiency ongoing
- Contact LNA Flue Gas Solutions Group for more information
